

GreatPM

An AI product-management operating system

Native plugins for Codex and Claude Code
Optional read-only MCP knowledge channel

Vandana Ajay Dubey
Assignment 4 - C51

The product decision problem

Intended users

**Founder-PMs and small product teams
working inside an AI coding environment**

A fuzzy request can become a build

The user, desired outcome and evidence may remain unclear while an AI assistant starts producing artifacts.

Context fragments across the work

Research, strategy and product requirements need continuity as the team moves toward launch.

Product hypotheses to validate with independent users

The GreatPM proposition

A structured product process in the AI workspace

Specialist roles draft the work. Project memory carries context.
The human approves consequential decisions.

48	79	34	26
Specialist definitions	Product-management skills	Workflows	Templates

Full native package in Codex and Claude Code

Six stages with three human gates

Stage	Typical product work	Human control
Discover	Evidence and customer needs	
Strategize	Positioning and product direction	
Prioritize	Tradeoffs and roadmap	Strategy approval
Define	PRD and success metrics	Specification approval
Launch	Readiness and rollout	Launch approval
Measure	Results and next questions	Next discovery cycle

Agents propose. The human approves strategy, specification and launch.

GreatPM Grill Me

\$grill-me

Challenges fuzzy thinking before a team commits

Illustrative request

“Add an AI onboarding assistant.”

Questions worth answering

Who gets stuck today?

Where does onboarding break?

Could a simpler change solve it?

Output: a sharper situation brief and explicit unknowns.

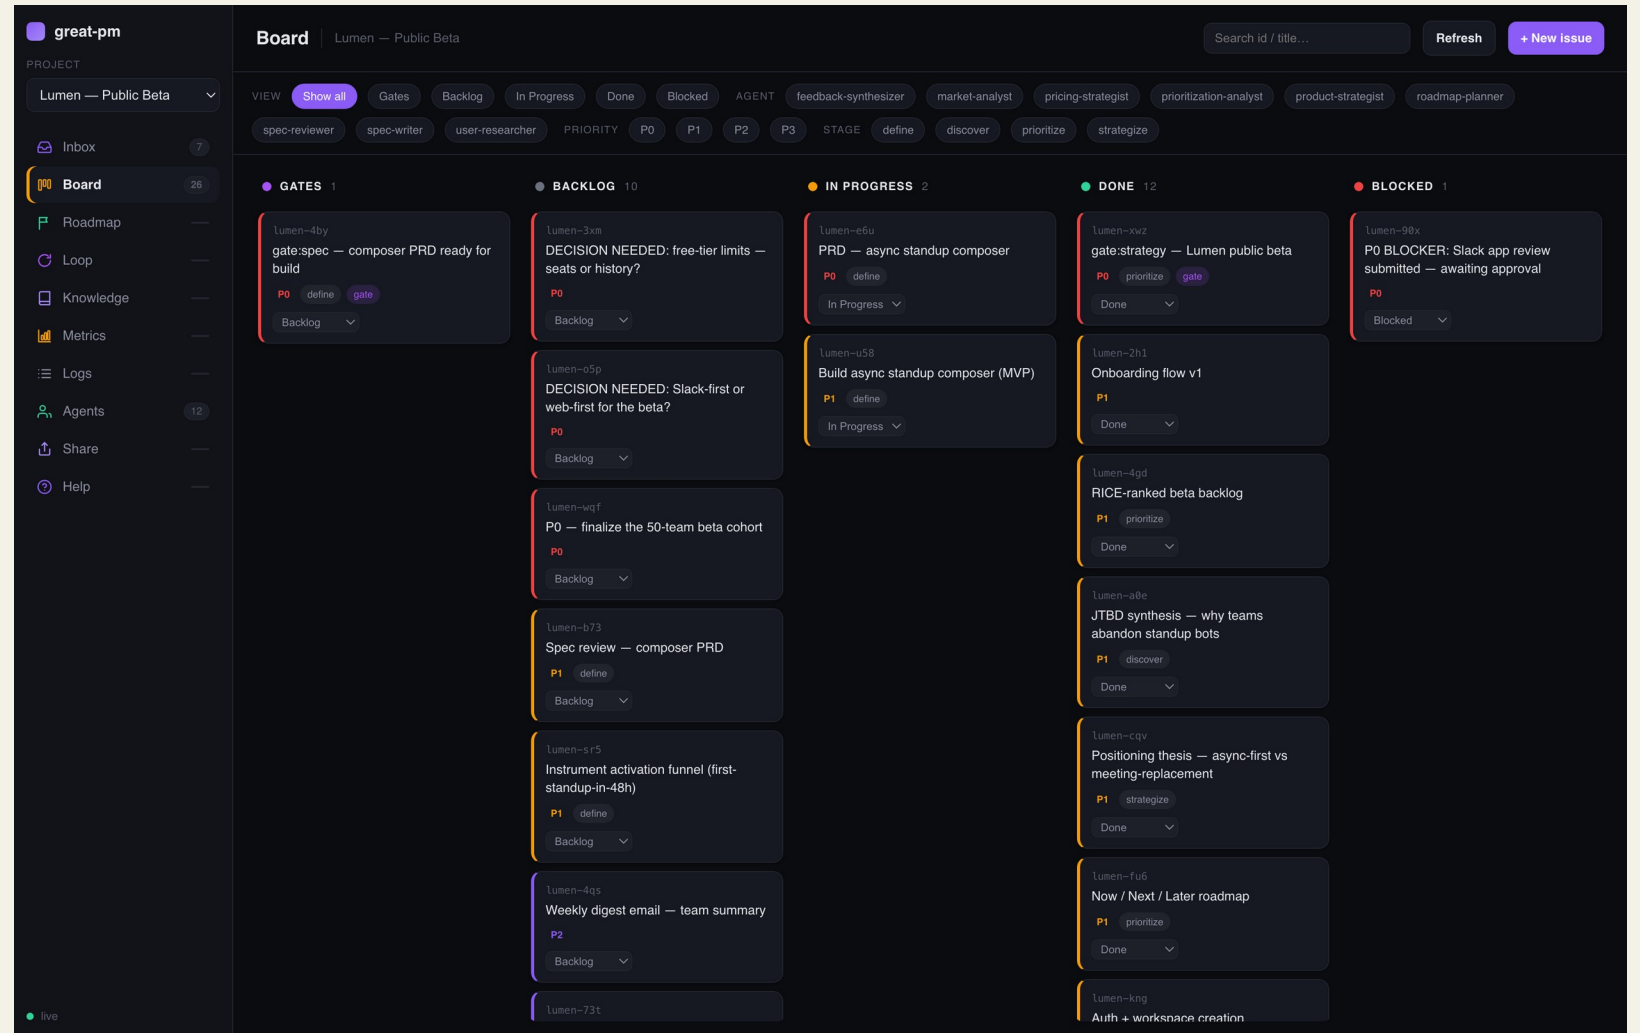

The human can answer, skip or override.

The local product board

Demo data

One place to
inspect
product work and
pending decisions

A local view of the
project's .great-pm state

Native plugin and MCP have different roles

Capability	Full native plugin	Optional public MCP
Primary use	Run product workflows	Retrieve methods and prepare plans
Product knowledge	79 skills and 26 templates	28 methods and 10 templates
Specialist workflow	48 role definitions	No agent execution
Project continuity	Local .great-pm state and board	No project-file access
External tools	Optional governed connectors	No external writes

**Codex and Claude Code host the full experience.
Compatible MCP clients get selected knowledge.**

The optional MCP knowledge channel

28 methods 10 templates 11 prompts

Read-only tool	What it returns
greatpm_list_methods	Searchable method metadata
greatpm_get_method	Complete guidance for one method
greatpm_prepare_workflow	A plan with methods, artifacts and human gates

MCP prepares the workflow. It does not execute or approve it.

Implementation prepared. Hosting is outside this submission.

How I built GreatPM

Layer	Build approach
Product system	Adapted the foundation to the six-stage PM loop, PM specialists, product methods and human gates
Native hosts	Kept canonical Claude Code content. Generated a Codex package with compatible role identifiers and files
Knowledge channel	Added a TypeScript MCP service over Streamable HTTP with curated static methods, templates and prompts

Built on the MIT-licensed `great_cto` foundation

Versioned source and native package v1.1.6 on GitHub

Current status and learning priorities

Available now

Versioned code on GitHub.
Native package for Codex and Claude Code.
Local product board and project memory.

Prepared separately

Curated read-only MCP implementation.
The hosted release is outside this submission.

What still needs independent evidence

Can a new PM complete setup and the first workflow?
Does Grill Me improve the clarity of a decision brief?
Do users understand where human approval is required?
